INSTALLATION

RENOR® II
0-10V DIMMING CONTROL
Cat. Nos. AWRMG-7XX, AWSMG-7XX & AWSMT-7XX

INPUT - 120 - 277 VAC 60 Hz
OUTPUT - 7D 16A

FEATURES AND OPERATION

• Turn Device ON or OFF – Pressing the switch will turn the device ON if the device is OFF, or if the device is ON, pressing the switch will turn the device OFF.

• Set Device Level – Adjust the knob or slider to set the desired output level. When the device turns ON, the device always turns ON to the level set by the slider or knob.

• Set Cutoff Level – The Cutoff Level is the lowest voltage the dimmer will output. To set the cutoff level, adjust the knob or slider to the desired minimum output level, then push and hold the power button for 10 seconds. The dimmer will adjust to the new level. When the knob or slider is at the full minimum position, each time the button is held for 10 seconds the minimum level will alternate between factory default and true minimum. If your load is flickering, not turning ON, or suffering from any other erratic behavior at the minimum setting, raising the cutoff level may eliminate the problem. If your load will not dim, reset the cutoff level to 0 and then reset desired minimum level.

• Set Maximum Level – The Maximum Level is the highest voltage the dimmer will output. To set the level, adjust the knob or slider to the maximum output. After the green LED blinks, lower the output to the desired level (LED 0-5s), then push and hold the power button for 10 seconds. The dimmer will adjust to the new level. To return to factory default (maximum), position the knob or slider to its maximum position, wait for the green LED to blink, and then push and hold the power button for 10 seconds. Your device will return to the maximum brightness position. The Maximum Level programming state will terminate after 20 seconds, or when the knob or slider is placed at the minimum position.

• Preset Operation – While device is off, set level of device. Then press button. The device will turn on at the set level.

• Power Restore – Upon restoration of power, the device turns ON to the state it was in at the time of power loss.

• 5-Way Operation – Link together 2, 3, 4, or 5 devices for multi-way dimming. All connected devices must be powered by the same electrical circuit to ensure proper communication between the devices.

• LED Locator – At the bottom of the switch is an LED locator. This locator illuminates when the device is OFF so you can find the device in the dark.

• Remote Control – If you are using a remote, the operation at the remote is identical to the operation at the master. A slight reaction delay may be noticed if operating level changes very quickly.

INSTALLATION REQUIREMENTS

These devices are designed for installation into a metal 2” x 3” (5.08 cm x 7.62 cm) single gang or multi-gang device back box. 2-1/16” (6.35 cm) deep back boxes are required. These devices are not designed for a multi-gang field configured box. In some installations conduit eater from the side is, or in, multi-gang installations where nipples between two adjacent boxes are used, deeper back boxes may be necessary. Test fit installation prior to rough-in.

• Installation of multiple devices into a single box may require de-rating and other specific installation provisions. Reference Multi-Gang Installations for more details.

• As devices vent top/bottom, devices should not be installed vertically (one over the other).

• To avoid flickering, flashing, or lights on one device adjusting when another device’s level is changed, do not share neutrals. Run separate neutrals for each load circuit back to the device (See Figure 1).

INSTALLATION INSTRUCTIONS

1. WARNING: TO AVOID FIRE, SHOCK OR DEATH; TURN OFF POWER AT CIRCUIT BREAKER OR FUSE AND TEST THAT POWER IS OFF BEFORE WIRING!

2. Remove existing wall plate and switch, if applicable.

3. Connect wires per WIRING DIAGRAM. If traveler wire is not used it must be insulated with heat shrink tubing or other approved method of insulating.

4. Installation may now be completed by carefully positioning all wires to provide room in outlet box for device. Mount device into box with mounting screws supplied.

5. Install device control push button assembly and assembly (See Figure 2).

6. Snap faceplate into place.

7. Restore power at circuit breaker or fuse. Installation is complete.

7. Test Device operation.

FCC Compliance Statement

This device complies with Industry Canada license-exempt RSS standards(s). Operation is subject to the following two conditions: (1) this device may not cause interference, and (2) this device must accept any interference, including interference that may cause undesired operation of the device. IMPORTANT! Any changes or modifications not expressly approved by the party responsible for compliance could void the user’s authority to operate this equipment. This Class B digital apparatus complies with Canadian ICES-003.

IC Compliance Statement

For warranty information and product returns, residents of Canada should contact Leviton in writing at Leviton Manufacturing of Canada Ltd. at the attention of the Quality Assurance Department, 165 Hymus Blvd., Pointe-Claire (Quebec), Canada H9R 1E8 or by telephone at 1-800-405-5320.

**MULTI-GANG INSTALLATION REQUIREMENTS**

**Multi-Gang Installations:**
A multi-ganged installation exists when multiple devices are installed in the same back box. In multi-gang installations, the following may be required:
- Device de-rating
- Fin removal
- Use of joiner bars for adjacent devices
- Back box size

**NOTE:** TEST FIT DEVICE INSTALLATION WITH THE WALL PLATE PRIOR TO BREAKING FINS OR INSTALLING DEVICES TO ENSURE YOU UNDERSTAND ALL REQUIREMENTS.

**De-ratings:**
When fins are broken, some devices must be de-rated. Reference table below to determine the device ratings when 0, 1, or 2 fins are removed.

**Fluorescent - 0-10VDC Sinking Control - 120-277VAC/VCA, 50Hz**
Use only permanently installed electronic ballasted luminaire of fluorescent, HID, or LED load type with driver/ballast setup for 0-10VDC sinking control. Dimmer will sink maximum 75mA. Intended for the control of Advance Mark VII, Universal SuperDim®, Lutron® TVE, Leviton Oasis®, or Sylvania Quicktronic Powersense® ballast.

**CAUTION:** To reduce the risk of overheating and possible damage to other equipment, DO NOT install to control a receptacle, a motor-operated appliance, or a transformer supplied appliance.

**Fin Removal:**
When it is desired to install devices in as small a space as possible, all inside fins of like sized, adjacent devices can be broken off. Figure 4 show how to break off fins and the specific order in which multiple devices must be installed in multi-gang installations.

**Back Box Size & Joiner Bars:**
To determine the required back-box size in multi-gang installations, reference table below in applications where the devices do not line up with back box device mounting holes, use joiner bars to join the controls together. Reference Figure 5.

**Multi-Way Control:**
The Renoir® II product line supports up to 5-way control. Any combination of Dimmers, Fan Controls, Switches, or Remotes are supported with a MAXIMUM OF 5 DEVICES. Total run length from end to end is MAXIMUM 250 FEET. Remotes require Uncontrolled Hot, Neutral, & Ground for proper operation. One traveler wire is to run in between all masters and remotes. Remotes draw 15mA power (ea) from the Control to which they are connected.

**NOTE:** Remote Hot/Neutral should ideally be fed from the same circuit as the Master. If this is not possible, ensure that the master and remote are both fed from the same phase.

**Load after Remote Device/Switch and Master Device/Switch**

**Load in between Master Device/Switch and Remote Device/Switch**

**Multiple Device/Switches**
Maximum 5 Devices, Dimmers, Remotes or Fan Controls
Maximum 250 feet.

1. Find the cells that correspond to your application by identifying the row with the number of wide heat sink devices you have, and the columns that correspond to the number of narrow heat sink devices you have. In the cell you’ll find the following:
2. The number indicates the number of “Gangs” required.
3. The letters under the number indicate the order devices should be installed, N=narrow, W=wide.
4. **W** = right fin break-off on wide device, N = right fin break-off on narrow device.
   - **W** - left fin break-off on wide device, **N** - left fin break-off on narrow device.
   - **W** = fin break-off on both sides of wide device, **N** = fin break-off on both sides of narrow device.
5. **"** indicates that use of jumper bars is required. Jumper bars can be found in the kit with the faceplate.

**NOTE:** Metal finishes are not available on custom face plates.

**Basic WIDE/NARROW configurations, for additional configurations see:**
