WARNINGS AND CAUTIONS:

1. TO AVOID FIRE, SHOCK OR DEATH; TURN OFF POWER AT CIRCUIT BREAKER OR FUSE AND TEST THAT POWER IS OFF BEFORE WIRING!
2. TO BE INSTALLED AND/OR USED IN ACCORDANCE WITH ELECTRICAL CODES AND REGULATIONS.
3. IF YOU ARE NOT SURE ABOUT ANY PART OF THESE INSTRUCTIONS, CONSULT AN ELECTRICIAN.
4. DO NOT INSTALL VERTICALLY.
5. ONLY INSTALL FOR THE ALLOWED LOAD TYPES. INSTALLATION FOR ANY OTHER LOAD TYPE WILL VOID WARRANTY AND POSSIBLY CAUSE DAMAGE TO THIS DEVICE AND/OR CONNECTED EQUIPMENT.
6. USE THIS DEVICE WITH COPPER OR COPPER CLAD WIRE ONLY.

Features and Operation:

- Turn Device ON or OFF – Pressing the switch will turn the device ON if the device is OFF. If the device is ON, pressing the switch will turn the device OFF.
- Set Device Level – Adjust the knob or slider to set the desired output level. When the device turns ON, the device always turns ON to the level set by the slider or knob.
- Set Cutoff Level – The cutoff level is the lowest voltage the dimmer will output before shutting OFF. To set the cutoff level, adjust the knob or slider to the maximum output. Slowly lower the output to the desired cutoff level, then push and hold the power button for 10 seconds. The dimmer will adjust to the new level. To reset the cutoff level to 0, adjust the knob or slider to the minimum output, then push and hold the power button for 10 seconds. If your load is flickering, not turning ON, or suffering from any other erratic behavior at the minimum setting, raising the cutoff level may eliminate the problem. If your load will not dim, reset the cutoff level to 0 and then reset desired minimum level.
- Preset Operation – While device is off, set level of device. Then press button. The device will turn on at the set level.
- Power Restore – Upon restoration of power, the device turns ON to the state it was in at the time of power loss.
- 5-Way Operation – Link together 2, 3, 4, or 5 devices for multi-way dimming. All connected devices must be powered by the same electrical circuit to ensure proper communication between the devices.
- LED Locator – At the bottom of the switch is an LED locator. This locator illuminates when the device is OFF so you can find the device in the dark.
- Remote Control – If you are using a remote, the operation at the remote is identical to the operation at the master. A slight reaction delay may be noticed if operating level changes very quickly.
- Service Switch – Some units have a service switch which must be used to disconnect the load when replacing lamps. The breaker should be disconnected when performing any circuit service other than lamp replacement. See Figure 1.

Installation Requirements:

- These devices are designed for installation into a metal 2” x 3” (5.08 cm x 7.62 cm) gang box or multi-gang device back box. 2-1/2” (63.5 cm) or deeper back boxes are required. These devices are not designed for a multi-gang field configured box. In some installations where conduit entry is from the side, or in multi-gang installations where nipples between two adjacent boxes are used, deeper back boxes may be necessary. Test fit installation prior to rough-in.
- Installation of multiple devices into a single box may require de-rating and other specific installation provisions. Reference Multi-Gang Installations for more details.
- As devices vent top/bottom, devices should not be installed vertically (one over the other).
- To avoid flickering, flashing, or lights on one device adjusting when another device’s level is changed, do not share neutrals. Run separate neutrals for each load circuit back to the device (see Figure 2).

Installation Instructions:

1. WARNING: TO AVOID FIRE, SHOCK OR DEATH; TURN OFF POWER AT CIRCUIT BREAKER OR FUSE AND TEST THAT POWER IS OFF BEFORE WIRING!
2. Remove existing wall plate and switch, if applicable.
3. Connect wires per WIRING DIAGRAM. If traveler wire is not used it must be insulated (wire nut or electrical tape).
4. Installation may now be completed by carefully positioning all wires to provide room in outlet box for device. Mount device into box with mounting screws supplied.
5. Install device control push button and control assembly (see Figure 3).
6. Restore power at circuit breaker or fuse. Installation is complete.
7. Test Device operation.

Features and Operation:

- Turn Device ON or OFF – Pressing the switch will turn the device ON if the device is OFF. If the device is ON, pressing the switch will turn the device OFF.
- Set Device Level – Adjust the knob or slider to set the desired output level. When the device turns ON, the device always turns ON to the level set by the slider or knob.
- Set Cutoff Level – The cutoff level is the lowest voltage the dimmer will output before shutting OFF. To set the cutoff level, adjust the knob or slider to the maximum output. Slowly lower the output to the desired cutoff level, then push and hold the power button for 10 seconds. The dimmer will adjust to the new level. To reset the cutoff level to 0, adjust the knob or slider to the minimum output, then push and hold the power button for 10 seconds. If your load is flickering, not turning ON, or suffering from any other erratic behavior at the minimum setting, raising the cutoff level may eliminate the problem. If your load will not dim, reset the cutoff level to 0 and then reset desired minimum level.
- Preset Operation – While device is off, set level of device. Then press button. The device will turn on at the set level.
- Power Restore – Upon restoration of power, the device turns ON to the state it was in at the time of power loss.
- 5-Way Operation – Link together 2, 3, 4, or 5 devices for multi-way dimming. All connected devices must be powered by the same electrical circuit to ensure proper communication between the devices.
- LED Locator – At the bottom of the switch is an LED locator. This locator illuminates when the device is OFF so you can find the device in the dark.
- Remote Control – If you are using a remote, the operation at the remote is identical to the operation at the master. A slight reaction delay may be noticed if operating level changes very quickly.
- Service Switch – Some units have a service switch which must be used to disconnect the load when replacing lamps. The breaker should be disconnected when performing any circuit service other than lamp replacement. See Figure 1.

Installation Requirements:

- These devices are designed for installation into a metal 2” x 3” (5.08 cm x 7.62 cm) gang box or multi-gang device back box. 2-1/2” (63.5 cm) or deeper back boxes are required. These devices are not designed for a multi-gang field configured box. In some installations where conduit entry is from the side, or in multi-gang installations where nipples between two adjacent boxes are used, deeper back boxes may be necessary. - Service Switch – Some units have a service switch which must be used to disconnect the load when replacing lamps. The breaker should be disconnected when performing any circuit service other than lamp replacement. See Figure 1.

Installation Requirements:

- These devices are designed for installation into a metal 2” x 3” (5.08 cm x 7.62 cm) gang box or multi-gang device back box. 2-1/2” (63.5 cm) or deeper back boxes are required. These devices are not designed for a multi-gang field configured box. In some installations where conduit entry is from the side, or in multi-gang installations where nipples between two adjacent boxes are used, deeper back boxes may be necessary. Test fit installation prior to rough-in.
- Installation of multiple devices into a single box may require de-rating and other specific installation provisions. Reference Multi-Gang Installations for more details.
- As devices vent top/bottom, devices should not be installed vertically (one over the other).
- To avoid flickering, flashing, or lights on one device adjusting when another device’s level is changed, do not share neutrals. Run separate neutrals for each load circuit back to the device (see Figure 2).

Installation Instructions:

1. WARNING: TO AVOID FIRE, SHOCK OR DEATH; TURN OFF POWER AT CIRCUIT BREAKER OR FUSE AND TEST THAT POWER IS OFF BEFORE WIRING!
2. Remove existing wall plate and switch, if applicable.
3. Connect wires per WIRING DIAGRAM. If traveler wire is not used it must be insulated (wire nut or electrical tape).
4. Installation may now be completed by carefully positioning all wires to provide room in outlet box for device. Mount device into box with mounting screws supplied.
5. Install device control push button and control assembly (see Figure 3).
6. Restore power at circuit breaker or fuse. Installation is complete.
7. Test Device operation.
Multi-Gang Installations:
A multi-ganged installation exists when multiple devices are installed in the same back box. In multi-gang installations, the following may be required:
- Device de-rating
- Fin removal
- Use of joiner bars for adjacent devices
- Back box size

**NOTE:** TEST FIT DEVICE INSTALLATION WITH THE WALL PLATE PRIOR TO BREAKING FINS OR INSTALLING DEVICES TO ENSURE YOU UNDERSTAND ALL REQUIREMENTS.

De-ratings:
When fins are broken, some devices must be de-rated. Reference table below to determine the device ratings when 0, 1, or 2 fins are removed.

Electronic Low Voltage - 120-277VAC/VCA, 60HZ
Use only for permanently installed luminaire of load type: Incandescent, Tungsten, or Electronic Transformer. There is no minimum load required for proper operation of this device. CAUTION: To reduce risk of overheating and possible damage to other equipment, do not install to control a receptacle, a motor-operated appliance, or a fluorescent lighting luminaire.

Fin Removal:
When it is desired to install devices in as small a space as possible, all inside fins of like sized, adjacent devices can be broken off. **Figure 4** shows how to break off fins and the specific order in which multiple devices must be installed in multi-gang installations.

### Multi-Way Control:
The Renor II product line supports up to 5-way control. Any combination of Dimmers, Fan Controls, Switches, or Remotes are supported with a MAXIMUM OF 5 DEVICES. Total run length from end to end is **MAXIMUM 250 FEET**. Remotes require Uncontrolled Hot, Neutral, & Ground for proper operation. One traveler wire is to run in between all masters and remotes. Remote draws 15mA power (ea) from the Control to which those are connected.

**NOTE:** Remote Hot/Neutral should ideally be fed from the same circuit as the Master. If this is not possible, ensure that the master and remote are both fed from the same phase.

### Multi-Way Control Wiring Diagram

**Figure 5 - Joiner Bar**
Narrow/Narrow
Wide/Narrow
Wide/Wide

3-1/2" deep back box is required
3/4" space (use chase nipple)

### Additional - Single Gang Box

**Back Box Size & Joiner Bars:**
To determine the required back-box size in multi-gang installations, reference table below. In applications where the devices do not line up with back box device mounting holes, use joiner bars to join the controls together. Reference **Figure 5**.

1. Find the cells that correspond to your application by identifying the row with the number of devices in the front panel:
2. The number indicates the number of “Gangs” required.
3. The letters under the number indicate the order devices should be installed, N=narrow, W=wide.
4. W = right fin break-off on wide device, N = right fin break-off on narrow device.
5. W = left fin break-off on wide device, N = left fin break-off on narrow device.
6. W = fin break-off on both sides of wide device, N = fin break-off on both sides of narrow device.
7. **Indicates that use of jumper bars is required. Jumper bars can be found in the faceplate.**

**NOTE:** Metal finishes are not available on custom face plates.

### Basic WIDE/NARROW configurations, for additional configurations see: www.leviton.com/RENOIRII
